# How can Physics Inform Deep Learning Methods in Earth System Science:

Recent Progress and Future Prospects

#### **Anuj Karpatne**

Post-Doctoral Associate, University of Minnesota

karpa009@umn.edu http://www.cs.umn.edu/~anuj

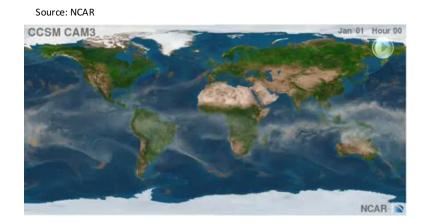

# Outline

- Why Deep Learning Needs Physics?
- "Theory-guided Data Science"
- Recent Progress
- Future Prospects

# Big Data in Earth System Science

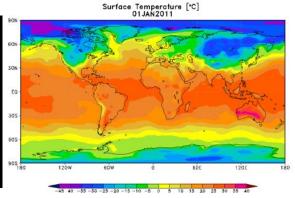

- Satellite Data
  - Spectral Reflectance
  - Elevation Models
  - Nighttime Lights
  - Aerosols
- Oceanographic Data
  - Temperature
  - Salinity
  - Circulation

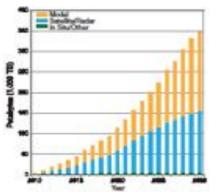

- Climate Models
- Reanalysis Data
- River Discharge
- Agricultural Statistics
- Population Data
- Air Quality
- ...

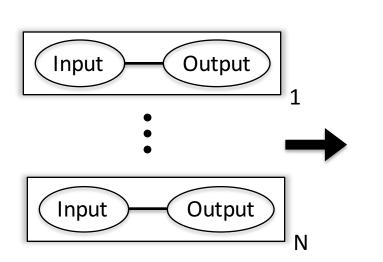

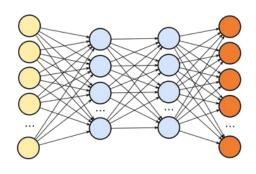

Source: NASA

# Age of Data Science

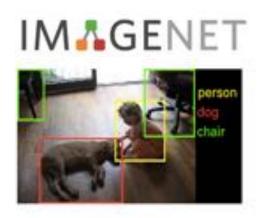

#### **Deep Learning**

"Black-box" models learn patterns and models solely from data without relying on scientific knowledge

Hugely successful in commercial applications:

# Promise of Data Science in Transforming Scientific Discovery

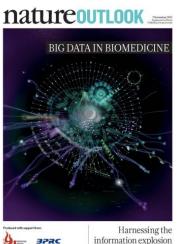

How Al is transforming science

Researchers are unleashing artificial intelligence (AI) on torrents of big data

"Unlike earlier attempts ...
[Al systems] can see patterns
and spot anomalies in data
sets far larger and messier
than human beings can cope
with."

# Promise of Data Science in Transforming Scientific Discovery

Science

How Al is transforming science

Researchers are unleashing

Will the rapidly growing area of "black-box" data science models make existing theory-based models obsolete?

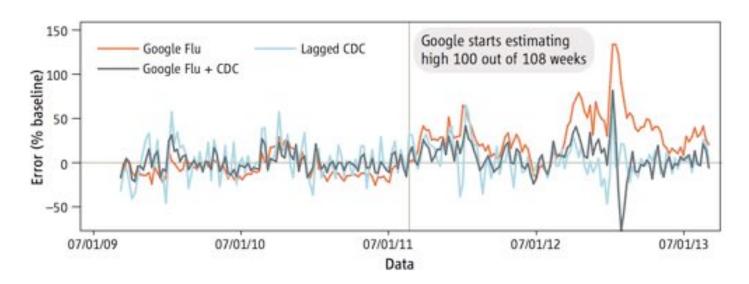

## Limits of "Black-box" Data Science Methods

#### The Parable of Google Flu: Traps in Big Data Analysis

- Predicted flu using Google search queries
- Overestimated by twice in later years

#### Climate Science:

#### **Geophysical Research Letters**

Statistical significance of climate sensitivity predictors obtained by data mining

## The New York Times

The Opinion Pages | OP-ED CONTRIBUTORS

#### Eight (No, Nine!) Problems With Big Data

By GARY MARCUS and ERNEST DAVIS APRIL 6, 201

" . . . you will always need to start with an analysis that relies on an understanding of physics and biochemistry."

# Why Do Black-box Methods Fail? (1/2)

- Scientific problems are often under-constrained
  - Complex, dynamic, and non-stationary relationships
  - Large number of variables, small number of samples
- Standard methods for evaluating ML models (e.g., cross-validation) break down
  - Easy to learn spurious relationships that look deceptively good on training and test sets
  - But lead to poor generalization outside the available data

Huge number of samples is critical to success of methods such as deep learning

11/29/17

# Why Do Black-box Methods Fail? (2/2)

Interpretability is an important end-goal (esp. in scientific problems)

Can we open the black box of Al?

Artificial intelligence is everywhere. But before scientists trust it, they first need to understand how machines learn.

- Castelvecchi 2016

- Need to explain or discover mechanisms of underlying processes to ...
  - Form a basis for scientific advancements
  - Safeguard against the learning of non-generalizable patterns

11/29/17

# Theory-based vs. Data Science Models

Contain knowledge gaps in describing certain processes (turbulence, groundwater flow)

**Gravitational Law** 

$$F = G \frac{m_1 m_2}{r^2}$$

Conservation of Mass, Momentum, Energy

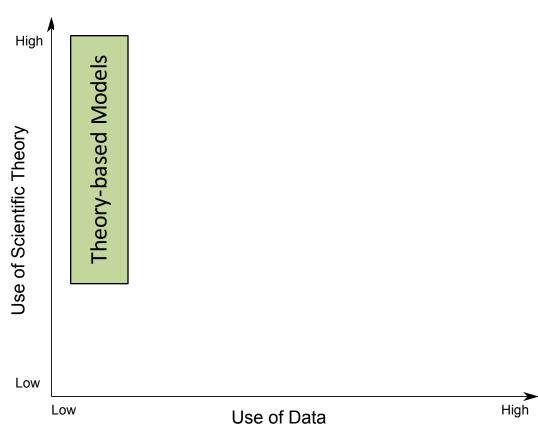

$$\frac{\partial \rho}{\partial t} = -\nabla \cdot (\rho \mathbf{u})$$

$$\frac{\partial \rho \mathbf{u}}{\partial t} = -\nabla \cdot \left(\frac{1}{\rho} (\rho \mathbf{u}) \otimes (\rho \mathbf{u}) + p \mathbf{I}\right) + \rho \mathbf{g}$$

$$\frac{\partial E}{\partial t} = -\nabla \cdot \left(\frac{1}{\rho} (E + p)(\rho \mathbf{u})\right) + \mathbf{u} \cdot \rho \mathbf{g}$$

**Navier-Stokes Equation** 

$$\rho \left( \frac{\partial v}{\partial t} + v \cdot \nabla v \right) = -\nabla p + \nabla \cdot T + f$$

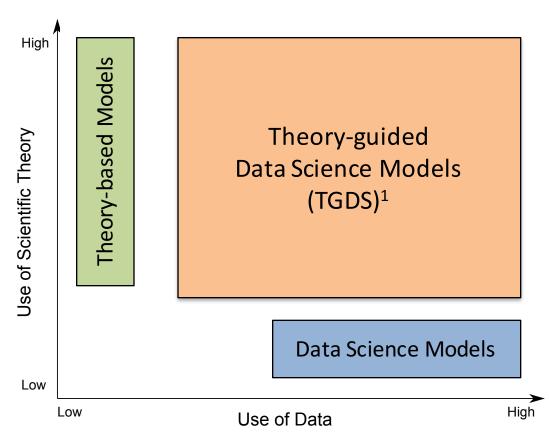

Schrodinger's Equation

$$\mathbf{H}\Psi = E\Psi$$

# Theory-based vs. Data Science Models

Contain knowledge gaps in describing certain processes (turbulence, groundwater flow)

Take full advantage of data science methods without ignoring the treasure of accumulated knowledge in scientific "theories"

<sup>1</sup> Karpatne et al. "**Theory-guided data science: A new paradigm for scientific discovery**," TKDE 2017

Require large number of representative samples

Workshop on Deep Learning for Physical Sciences 2017

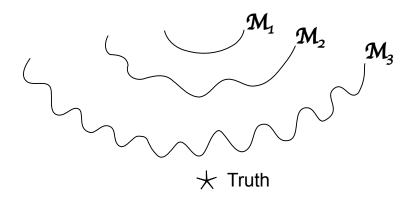

#### An Overarching Objective of TGDS

## Learning Physically Consistent Models

- Traditionally, "simpler" models are preferred for generalizability
  - Basis of several statistical principles such as bias-variance trade-off

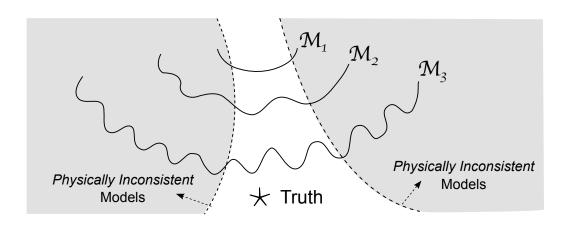

M1 (less complex model): High bias—Low variance

M<sub>3</sub> (more complex model): Low bias—High variance

#### An Overarching Objective of TGDS

# **Learning Physically Consistent Models**

- Traditionally, "simpler" models are preferred for generalizability
  - Basis of several statistical principles such as bias-variance trade-off

M1 (less complex model): High bias—Low variance

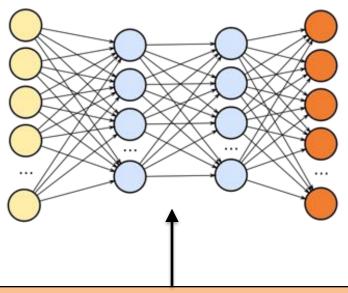

M3 (more complex model): Low bias—High variance

- In scientific problems, "physical consistency" can be used as another measure
  of generalizability
  - Can help in pruning large spaces of inconsistent solutions
  - Result in generalizable and physically meaningful results

Generalization Performance ∝ Accuracy + Simplicity + *Consistency* 

# Physics-Guided Neural Networks (PGNN)

A Framework for Learning **Physically Consistent** Deep Learning Models

#### **Scientific Knowledge (Physics)**

Used to guide selection of model architecture, activation functions, loss functions, ...

Karpatne et al., "Physics-guided neural networks (PGNN): Application in Lake Temperature Modeling," SDM 2018 (in review; **arXiv: 1710.11431**).

# Case Study: Lake Temperature Modeling

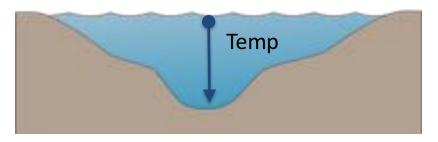

#### **Input Drivers:**

Short-wave Radiation,
Long-wave Radiation,
Air Temperature,
Relative Humidity,
Wind Speed,
Rain, ...

#### **Target Output:**

Temp. of water at every depth

## Physics-based Approach: General Lake Model (GLM)<sup>1</sup>

- Captures physical processes responsible for energy balance
- Requires lake-specific calibration using large amounts of data and computational resources

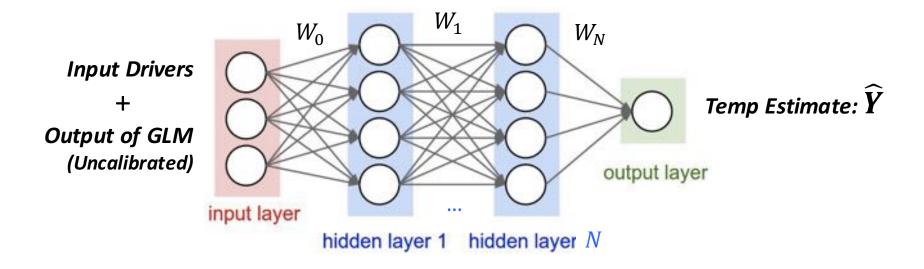

RMSE of Uncalibrated Model: 2.57

RMSE of Calibrated Model: 1.26

(for Lake Mille Lacs in Minnesota)

# PGNN 1: Use GLM Output as Input in Neural Network

- Deep Learning can augment physics-based models by modeling their errors
- Part of a broader research theme on creating hybrid-physics-data models

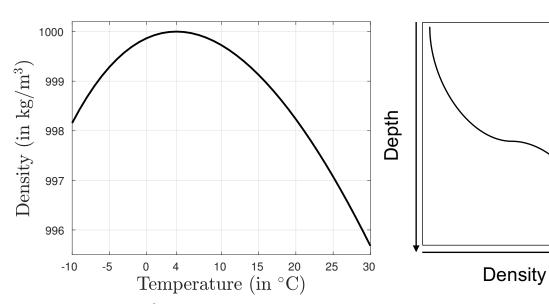

Loss Function = Training Loss 
$$(Y, \hat{Y}) + \lambda_1 ||W||_1 + \lambda_2 ||W||_2$$

#### PGNN 2:

## Use **Physics-based Loss Functions**

 Temp estimates need to be consistent with physical relationships b/w temp, density, and depth

#### **Physical Constraint:**

Denser water is at higher depth

$$\Delta_i = \widehat{\rho}_i - \widehat{\rho}_{i+1} \ge 0$$

If depth  $d_i > \text{depth } d_{i+1}$ 

Convert  $\widehat{Y}$  to density estimate  $\widehat{\rho}$  **Physics-based Loss** = Sum of Physical Violations

 $= \sum_{i} \text{ReLU}(\Delta_{i})$ 

Loss Function = Tr. Loss  $(Y, \hat{Y}) + \lambda_1 \|W\|_1 + \lambda_2 \|W\|_2 + \lambda_{PHY}$  Physics-based Loss

Does not require labels!

# Physical Consistency Ensures Generalizability

	GLM (Uncalibrated)	Black-box Neural Network	PGNN	GLM (Calibrated)
RMSE (in °C)	2.57	1.77	1.16	1.26

## Future Prospects: Theory-guided Data Science

#### 1. Theory-guided Learning

- Choice of Loss Function
- Constrained Optimization
   Methods
- Probabilistic Models

[Limnology, Chemistry, Biomedicine, Climate, Genomics]

#### 2. Theory-guided Design

- Choice of Response/Loss
   Functions
- Design of Model Architecture

[Turbulence Modeling, Neuroscience]

- 3. Theory-guided Refinement
- Post-processing
- Pruning

[Remote Sensing, Material Science]

- Creating Hybrid Models of Theory and Data Science
- Residual Modeling
- Predicting Intermediate Quantities

[Hydrology, Turbulence Modeling]

- 5. Augmenting Theory-based Models using Data
- Calibrating Model Parameters
- Data Assimilation

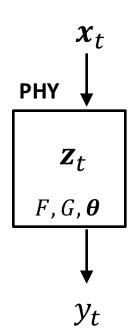

[Hydrology, Climate Science, Fluid Dynamics]

### **Future Prospects:**

# Hybrid-Physics-Data Models

Numerical Models in Earth System Sciences

$$y_t = F_{\theta}(x_t, z_t)$$
$$z_{t+1} = G_{\theta}(x_t, z_t)$$

Physics-based Models

x: input

y: output

z: state

 $\theta$ : parameters

F, G: Physics-based PDEs

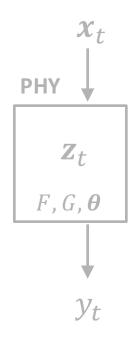

Contain knowledge gaps in describing certain processes

### **Future Prospects:**

# Hybrid-Physics-Data Models

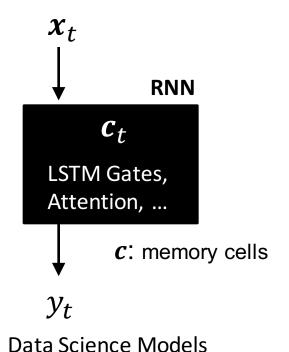

Numerical Models in Earth System Sciences

$$y_t = F_{\theta}(x_t, \mathbf{z}_t)$$
$$\mathbf{z}_{t+1} = G_{\theta}(x_t, \mathbf{z}_t)$$

Physics-based Models

Contain knowledge gaps in describing certain processes

Require large number of representative samples

 $\boldsymbol{x}$ : input

 $\nu$ : output

z: state

 $\theta$ : parameters

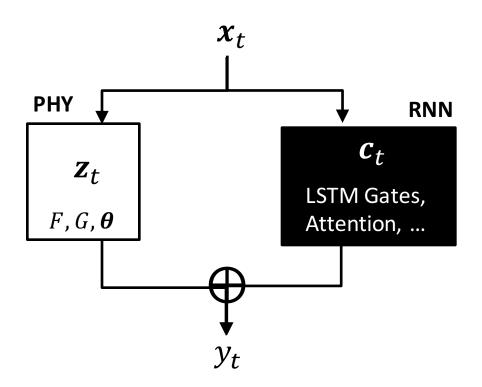

**F**, **G**: Physics-based PDEs

### **Future Prospects:**

# Hybrid-Physics-Data Models

Multiple ways of combining outputs

- Residual Modeling
- Mixture Modeling
- Density Ratio Modeling

Hybrid-Physics-Data Models

Overcome complementary weaknesses of both PHY and RNN

# **Concluding Remarks**

- "Black-box" deep learning methods not sufficient for knowledge discovery in scientific domains
- Physics can be combined with deep learning in a variety of ways under the paradigm of "theory-guided data science"
- Use of physical knowledge ensures physical consistency as well as generalizability
- Theory-guided data science is already starting to gain attention in several disciplines:
  - Climate science and hydrology
  - Turbulence modeling
  - Bio-medical science
  - Bio-marker discovery
  - Material discovery
  - Computational chemistry, ...
